

64Kb (8K x 8) TIMEKEEPER[®] SRAM

- INTEGRATED ULTRA LOW POWER SRAM, REAL TIME CLOCK, POWER-FAIL CONTROL CIRCUIT and BATTERY
- FREQUENCY TEST OUTPUT for REAL TIME CLOCK
- AUTOMATIC POWER-FAIL CHIP DESELECT and WRITE PROTECTION
- WRITE PROTECT VOLTAGES (V_{PFD} = Power-fail Deselect Voltage):
 - M48T59: $4.5V \leq V_{PFD} \leq 4.75V$
 - M48T59Y: $4.2V \leq V_{PFD} \leq 4.5V$
- SELF-CONTAINED BATTERY and CRYSTAL in the CAPHAT DIP PACKAGE
- PACKAGING INCLUDES a 28-LEAD SOIC and SNAPHAT[®] TOP (to be Ordered Separately)
- SOIC PACKAGE PROVIDES DIRECT CONNECTION for a SNAPHAT TOP which CONTAINS the BATTERY and CRYSTAL
- MICROPROCESSOR POWER-ON RESET (Valid even during battery back-up mode)
- PROGRAMMABLE ALARM OUTPUT ACTIVE in the BATTERY BACK-UP MODE

DESCRIPTION

The M48T59/59Y TIMEKEEPER[®] RAM is an 8K x 8 non-volatile static RAM and real time clock. The monolithic chip is available in two special packages to provide a highly integrated battery backed-up memory and real time clock solution.

Table 1. Signal Names

A0-A12	Address Inputs
DQ0-DQ7	Data Inputs / Outputs
$\overline{IRQ/FT}$	Interrupt / Frequency Test Output (Open Drain)
\overline{RST}	Power Fail Reset Output (Open Drain)
\overline{E}	Chip Enable
\overline{G}	Output Enable
\overline{W}	Write Enable
V_{CC}	Supply Voltage
V_{SS}	Ground

Table 2. Absolute Maximum Ratings ⁽¹⁾

Symbol	Parameter	Value	Unit
T _A	Ambient Operating Temperature	0 to 70	°C
T _{STG}	Storage Temperature (V _{CC} Off, Oscillator Off)	–40 to 85	°C
T _{SLD} ⁽²⁾	Lead Solder Temperature for 10 seconds	260	°C
V _{IO}	Input or Output Voltages	–0.3 to 7	V
V _{CC}	Supply Voltage	–0.3 to 7	V
I _O	Output Current	20	mA
P _D	Power Dissipation	1	W

Notes: 1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to the absolute maximum rating conditions for extended periods of time may affect reliability.

2. Soldering temperature not to exceed 260°C for 10 seconds (total thermal budget not to exceed 150°C for longer than 30 seconds).

CAUTION: Negative undershoots below –0.3 volts are not allowed on any pin while in the Battery Back-up mode.

CAUTION: Do NOT wave solder SOIC to avoid damaging SNAPHAT sockets.

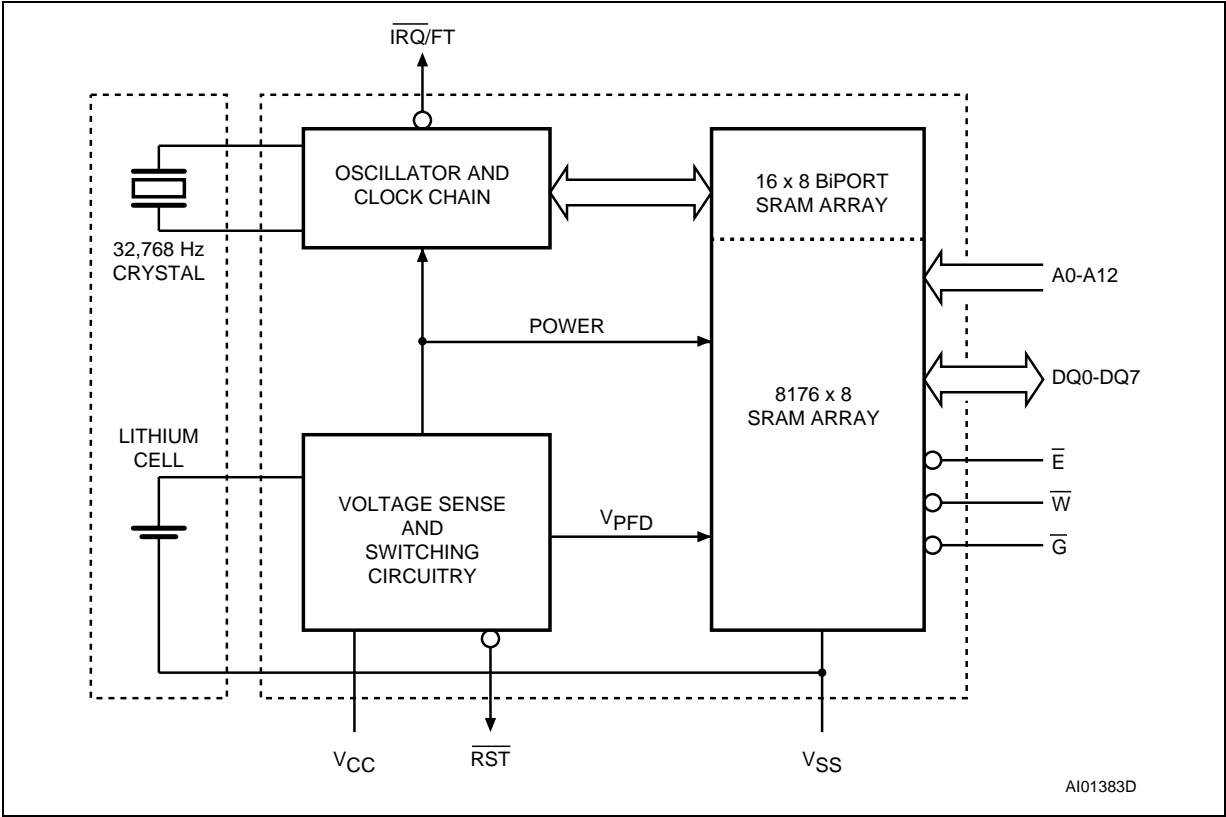

Table 3. Operating Modes ⁽¹⁾

Mode	V _{CC}	E-bar	G-bar	W-bar	DQ0-DQ7	Power
Deselect	4.75V to 5.5V or 4.5V to 5.5V	V _{IH}	X	X	High Z	Standby
Write		V _{IL}	X	V _{IL}	D _{IN}	Active
Read		V _{IL}	V _{IL}	V _{IH}	D _{OUT}	Active
Read		V _{IL}	V _{IH}	V _{IH}	High Z	Active
Deselect	V _{SO} to V _{PFD} (min) ⁽²⁾	X	X	X	High Z	CMOS Standby
Deselect	≤ V _{SO}	X	X	X	High Z	Battery Back-up Mode

Notes: 1. X = V_{IH} or V_{IL}; V_{SO} = Battery Back-up Switchover Voltage.

2. See Table 7 for details.

Figure 3. Block Diagram

The M48T59/59Y is a non-volatile pin and function equivalent to any JEDEC standard 8K x 8 SRAM. It also easily fits into many ROM, EPROM, and EEPROM sockets, providing the non-volatility of PROMs without any requirement for special write timing or limitations on the number of writes that can be performed.

The 28 pin 600mil DIP CAPHAT™ houses the M48T59/59Y silicon with a quartz crystal and a long life lithium button cell in a single package.

The 28 pin 330mil SOIC provides sockets with gold plated contacts at both ends for direct connection to a separate SNAPHAT housing containing the battery and crystal. The unique design allows the SNAPHAT battery package to be mounted on top of the SOIC package after the completion of the surface mount process. Insertion of the SNAPHAT housing after reflow prevents potential battery and crystal damage due to the high temperatures required for device surface-mounting. The SNAPHAT housing is keyed to prevent reverse insertion.

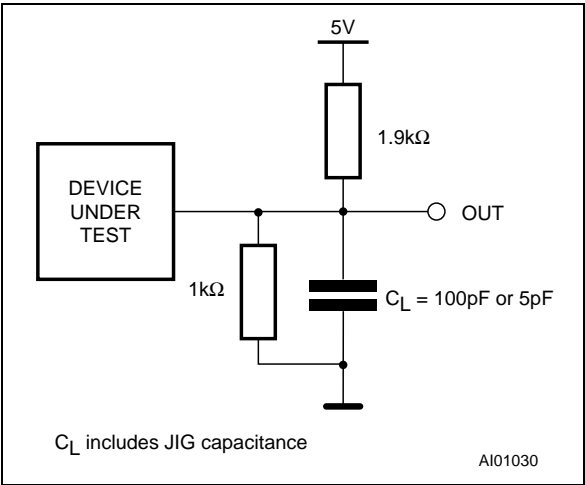

The SOIC and battery/crystal packages are shipped separately in plastic anti-static tubes or in Tape & Reel form. For the 28 lead SOIC, the battery/crystal package (i.e. SNAPHAT) part number is "M4T28-BR12SH1".

Table 4. AC Measurement Conditions

Input Rise and Fall Times	≤ 5ns

DESCRIPTION (cont'd)

As Figure 3 shows, the static memory array and the quartz controlled clock oscillator of the M48T59/59Y are integrated on one silicon chip.

The two circuits are interconnected at the upper eight memory locations to provide user accessible BYTEWIDE™ clock information in the bytes with

addresses 1FF8h-1FFFh. The clock locations contain the year, month, date, day, hour, minute, and second in 24 hour BCD format. Corrections for 28, 29 (leap year), 30, and 31 day months are made automatically. Byte 1FF8h is the clock control register. This byte controls user access to the clock information and also stores the clock calibration setting.

Table 8. Power Down/Up Mode AC Characteristics
($T_A = 0$ to 70°C)

Symbol	Parameter	Min	Max	Unit
t_{PD}	\overline{E} or \overline{W} at V_{IH} before Power Down	0		μs
$t_F^{(1)}$	$V_{PFD}(\text{max})$ to $V_{PFD}(\text{min})$ V_{CC} Fall Time	300		μs
$t_{FB}^{(2)}$	$V_{PFD}(\text{min})$ to V_{SO} V_{CC} Fall Time	10		μs
t_R	$V_{PFD}(\text{min})$ to $V_{PFD}(\text{max})$ V_{CC} Rise Time	10		μs
t_{RB}	V_{SO} to $V_{PFD}(\text{min})$ V_{CC} Rise Time	1		μs
t_{REC}	$V_{PFD}(\text{max})$ to \overline{RST} High	40	200	ms

Notes: 1. $V_{PFD}(\text{max})$ to $V_{PFD}(\text{min})$ fall time of less than t_F may result in deselection/write protection not occurring until $200\ \mu\text{s}$ after V_{CC} passes $V_{PFD}(\text{min})$.
2. $V_{PFD}(\text{min})$ to V_{SO} fall time of less than t_{FB} may cause corruption of RAM data.

Notes: 1. C_L = 5pF (see Figure 4).2. If \overline{E} goes low simultaneously with \overline{W} going low, the outputs remain in the high impedance state.**DESCRIPTION (cont'd)**

The eight clock bytes are not the actual clock counters themselves; they are memory locations consisting of BiPORT™ read/write memory cells. The M48T59/59Y includes a clock control circuit which updates the clock bytes with current information once per second. The information can be accessed by the user in the same manner as any other location in the static memory array.

The M48T59/59Y also has its own Power-fail Detect circuit. The control circuitry constantly monitors the single 5V supply for an out of tolerance condition. When V_{CC} is out of tolerance, the circuit write protects the SRAM, providing a high degree of data security in the midst of unpredictable system operation brought on by low V_{CC}. As V_{CC} falls below approximately 3V, the control circuitry connects the battery which maintains data and clock operation until valid power returns.

READ MODE

The M48T59/59Y is in the Read Mode whenever \overline{W} (Write Enable) is high and \overline{E} (Chip Enable) is low. The unique address specified by the 13 Address Inputs defines which one of the 8,192 bytes of data is to be accessed. Valid data will be available at the Data I/O pins within Address Access time (t_{AVQV}) after the last address input signal is stable, providing that the \overline{E} and \overline{G} access times are also satisfied. If the \overline{E} and \overline{G} access times are not met, valid data will be available after the latter of the Chip Enable Access time (t_{ELQV}) or Output Enable Access time (t_{GLQV}).

The state of the eight three-state Data I/O signals is controlled by \overline{E} and \overline{G} . If the outputs are activated before t_{AVQV}, the data lines will be driven to an indeterminate state until t_{AVQV}. If the Address Inputs are changed while \overline{E} and \overline{G} remain active, output data will remain valid for Output Data Hold time (t_{AXQX}) but will go indeterminate until the next Address Access.

Figure 7. Write Enable Controlled, Write AC Waveforms

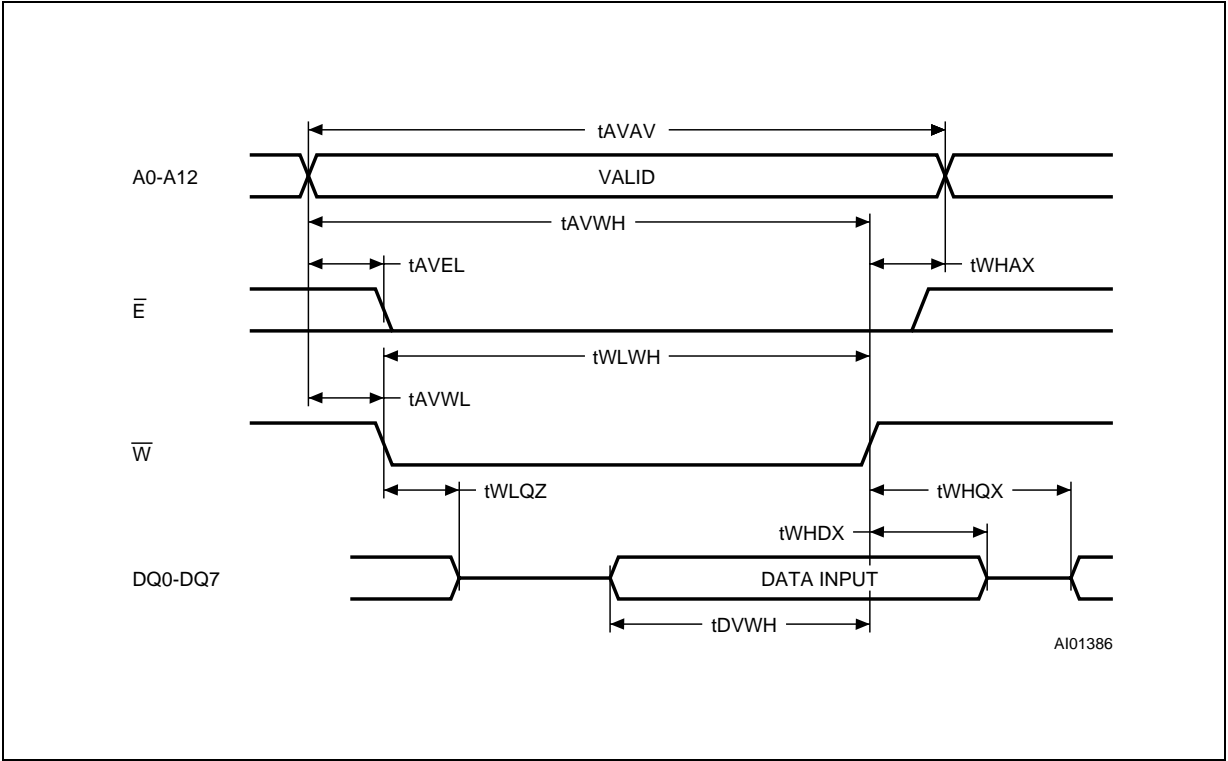

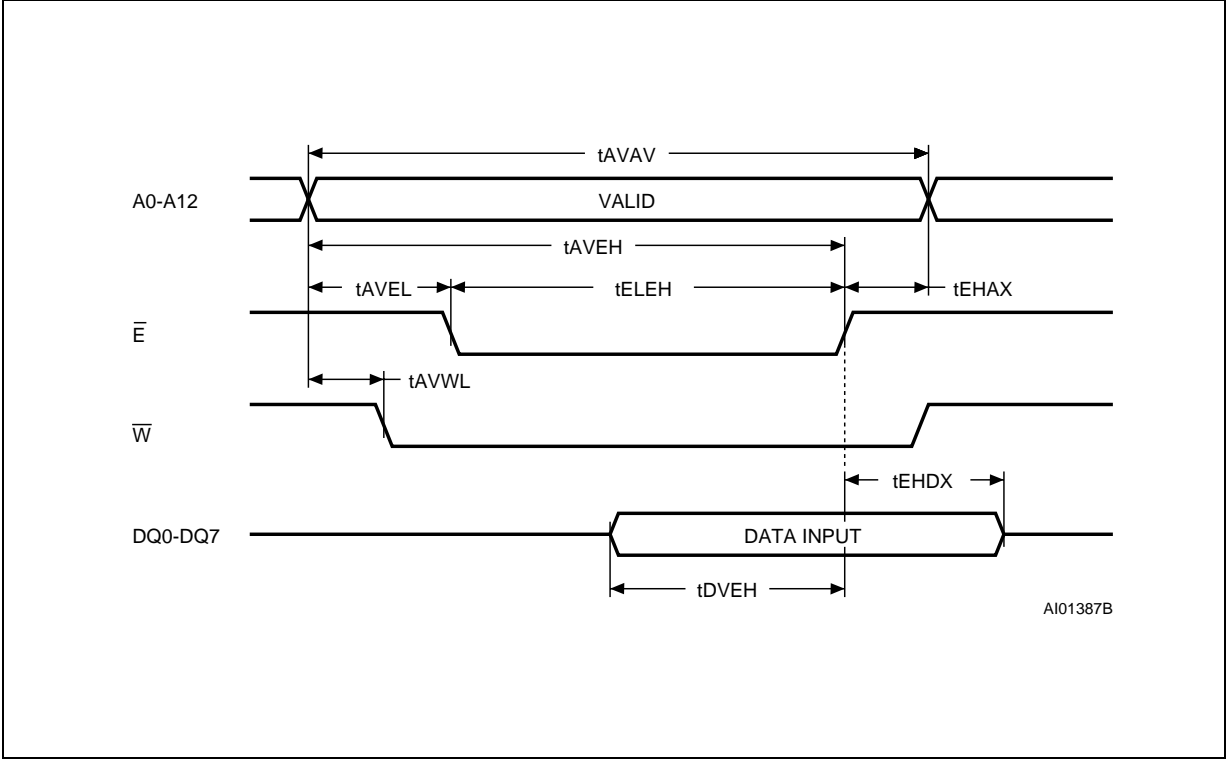

Figure 8. Chip Enable Controlled, Write AC Waveforms

WRITE MODE

The M48T59/59Y is in the Write Mode whenever \overline{W} and \overline{E} are low. The start of a write is referenced from the latter occurring falling edge of \overline{W} or \overline{E} . A write is terminated by the earlier rising edge of \overline{W} or \overline{E} . The addresses must be held valid throughout the cycle. \overline{E} or \overline{W} must return high for a minimum of t_{EHAX} from Chip Enable or t_{WHAX} from Write Enable prior to the initiation of another read or write cycle. Data-in must be valid t_{DVWH} prior to the end of write and remain valid for t_{WHDx} afterward. \overline{G} should be kept high during write cycles to avoid bus contention; although, if the output bus has been activated by a low on \overline{E} and \overline{G} a low on \overline{W} will disable the outputs t_{WLQZ} after \overline{W} falls.

DATA RETENTION MODE

With valid V_{CC} applied, the M48T59/59Y operates as a conventional BYTEWIDE static RAM. Should the supply voltage decay, the RAM will automatically power-fail deselect, write protecting itself when V_{CC} falls within the $V_{PFD(max)}$, $V_{PFD(min)}$ window. All outputs become high impedance, and all inputs are treated as "don't care."

Note: A power failure during a write cycle may corrupt data at the currently addressed location, but does not jeopardize the rest of the RAM's content. At voltages below $V_{PFD(min)}$, the user can be assured the memory will be in a write protected state, provided the V_{CC} fall time is not less than t_F . The M48T59/59Y may respond to transient noise spikes on V_{CC} that reach into the deselect window

Table 11. Register Map

Address	Data								Function/Range BCD Format	
	D7	D6	D5	D4	D3	D2	D1	D0

1FF0h	WDF	AF	Z	BL	Z	Z	Z	Z	Flags	

Keys: S = SIGN Bit
 FT = FREQUENCY TEST Bit
 R = READ Bit
 W = WRITE Bit
 ST = STOP Bit
 0 = Must be set to '0'
 Y = '1' or '0'
 Z = '0' and are Read only

AF = Alarm Flag
 BL = Battery Low
 WDS = Watchdog Steering Bit
 BMB0-BMB4 = Watchdog Multiplier Bits
 RB0-RB1 = Watchdog Resolution Bits
 AFE = Alarm Flag Enable
 ABE = Alarm in Battery Back-up Mode Enable
 RPT1-RPT4 = Alarm Repeat Mode Bits
 WDF = Watchdog Flag

DATA RETENTION MODE (cont'd)

during the time the device is sampling V_{CC} . Therefore, decoupling of the power supply lines is recommended.

When V_{CC} drops below V_{SO} , the control circuit switches power to the internal battery which preserves data and powers the clock. The internal button cell will maintain data in the M48T59/59Y for an accumulated period of at least 7 years when V_{CC} is less than V_{SO} . As system power returns and V_{CC} rises above V_{SO} , the battery is disconnected, and the power supply is switched to external V_{CC} . Deselect continues for t_{REC} after V_{CC} reaches $V_{PFD(max)}$.

For more information on Battery Storage Life refer to the Application Note AN1012.

POWER-ON RESET

The M48T59/59Y continuously monitors V_{CC} . When V_{CC} falls to the power fail detect trip point, the RST pulls low (open drain) and remains low on power-up for 40ms to 200ms after V_{CC} passes V_{PFD} . A 1k Ω resistor is recommended in order to control the rise time. The reset pulse remains active with V_{CC} at V_{SS} .

CLOCK OPERATIONS

Reading the Clock

Updates to the TIMEKEEPER registers should be halted before clock data is read to prevent reading data in transition. Because the BiPORT TIMEKEEPER cells in the RAM array are only data registers, and not the actual clock counters, updating the registers can be halted without disturbing the clock itself.

Updating is halted when a '1' is written to the READ bit, D6 in the Control register (1FF8h). As long as a '1' remains in that position, updating is halted.

After a halt is issued, the registers reflect the count; that is, the day, date, and the time that were current at the moment the halt command was issued.

All of the TIMEKEEPER registers are updated simultaneously. A halt will not interrupt an update in progress. Updating is within a second after the bit is reset to a '0'.

Setting the Clock

Bit D7 of the Control register (1FF8h) is the WRITE bit. Setting the WRITE bit to a '1', like the READ bit, halts updates to the TIMEKEEPER registers. The user can then load them with the correct day, date, and time data in 24 hour BCD format (see Table 12). Resetting the WRITE bit to a '0' then transfers the values of all time registers (1FF9h-1FFFh) to the actual TIMEKEEPER counters and allows normal operation to resume. After the WRITE bit is reset, the next clock update will occur within one second.

See the Application Note AN923 "TIMEKEEPER rolling into the 21st century" for information on Century Rollover.

Stopping and Starting the Oscillator

The oscillator may be stopped at any time. If the device is going to spend a significant amount of time on the shelf, the oscillator can be turned off to minimize current drain on the battery. The STOP bit is the MSB of the seconds register. Setting it to a '1' stops the oscillator. The M48T59/59Y is shipped from SGS-THOMSON with the STOP bit set to a '1'. When reset to a '0', the M48T59/59Y oscillator starts within one second.

Figure 9. Clock Calibration

Calibrating the Clock

The M48T59/59Y is driven by a quartz controlled oscillator with a nominal frequency of 32,768 Hz. The devices are tested not to exceed 35 ppm (parts per million) oscillator frequency error at 25°C, which equates to about ± 1.53 minutes per month. With the calibration bits properly set, the accuracy of each M48T59/59Y improves to better than ± 4 ppm at 25°C.

The oscillation rate of any crystal changes with temperature (see Figure 10). Most clock chips compensate for crystal frequency and temperature shift error with cumbersome trim capacitors. The M48T59/59Y design, however, employs periodic counter correction. The calibration circuit adds or subtracts counts from the oscillator divider circuit at the divide by 256 stage, as shown in Figure 9. The number of times pulses are blanked (subtracted, negative calibration) or split (added, positive calibration) depends upon the value loaded into the five bit Calibration byte found in the Control Register. Adding counts speeds the clock up, subtracting counts slows the clock down.

The Calibration byte occupies the five lower order bits (D4-D0) in the Control register (1FF8h). These bits can be set to represent any value between 0 and 31 in binary form. Bit D5 is a Sign bit; '1' indicates positive calibration, '0' indicates negative calibration. Calibration occurs within a 64 minute

cycle. The first 62 minutes in the cycle may, once per minute, have one second either shortened by 128 or lengthened by 256 oscillator cycles. If a binary '1' is loaded into the register, only the first 2 minutes in the 64 minute cycle will be modified; if a binary 6 is loaded, the first 12 will be affected, and so on.

Therefore, each calibration step has the effect of adding 512 or subtracting 256 oscillator cycles; for every 125,829,120 actual oscillator cycles, that is +4.068 or -2.034 ppm of adjustment per calibration step in the calibration register. Assuming that the oscillator is in fact running at exactly 32,768 Hz, each of the 31 increments in the Calibration byte would represent +10.7 or -5.35 seconds per month which corresponds to a total range of +5.5 or -2.75 minutes per month.

Two methods are available for ascertaining how much calibration a given M48T59/59Y may require. The first involves simply setting the clock, letting it run for a month and comparing it to a known accurate reference (like WWV broadcasts). While that may seem crude, it allows the designer to give the end user the ability to calibrate his clock as his environment may require, even after the final product is packaged in a non-user serviceable enclosure. All the designer has to do is provide a simple utility that accesses the Calibration byte.

Figure 10. Crystal Accuracy Across Temperature

DATA RETENTION MODE (cont'd)

The second approach is better suited to a manufacturing environment, and involves the use of the $\overline{\text{IRQ}}/\text{FT}$ pin. The pin will toggle at 512Hz when the Stop bit (D7 of 1FF9h) is '0', the FT bit (D6 of 1FFCh) is '1', the AFE bit (D7 of 1FF6h) is '0', and the Watchdog Steering bit (D7 of 1FF7h) is '1' or the Watchdog Register is reset (1FF7h = 0).

Any deviation from 512 Hz indicates the degree and direction of oscillator frequency shift at the test temperature. For example, a reading of 512.01024 Hz would indicate a +20 ppm oscillator frequency error, requiring a -10 (WR001010) to be loaded into the Calibration Byte for correction. Note that setting or changing the Calibration Byte does not affect the Frequency test output frequency.

The $\overline{\text{IRQ}}/\text{FT}$ pin is an open drain output which requires a pull-up resistor for proper operation. A 500-10k Ω resistor is recommended in order to control the rise time. The FT bit is cleared on power-up.

For more information on calibration, see the Application Note AN934 "TIMEKEEPER Calibration".

SETTING ALARM CLOCK

Registers 1FF5h-1FF2h contain the alarm settings. The alarm can be configured to go off at a prescribed time on a specific day of the month or repeat every day, hour, minute, or second. It can also be programmed to go off while the M48T59 is in the battery back-up mode of operation to serve as a system wake-up call.

RPT1-RPT4 put the alarm in the repeat mode of operation. Table 12 shows the possible configurations. Codes not listed in the table default to the once per second mode to quickly alert the user of an incorrect alarm setting.

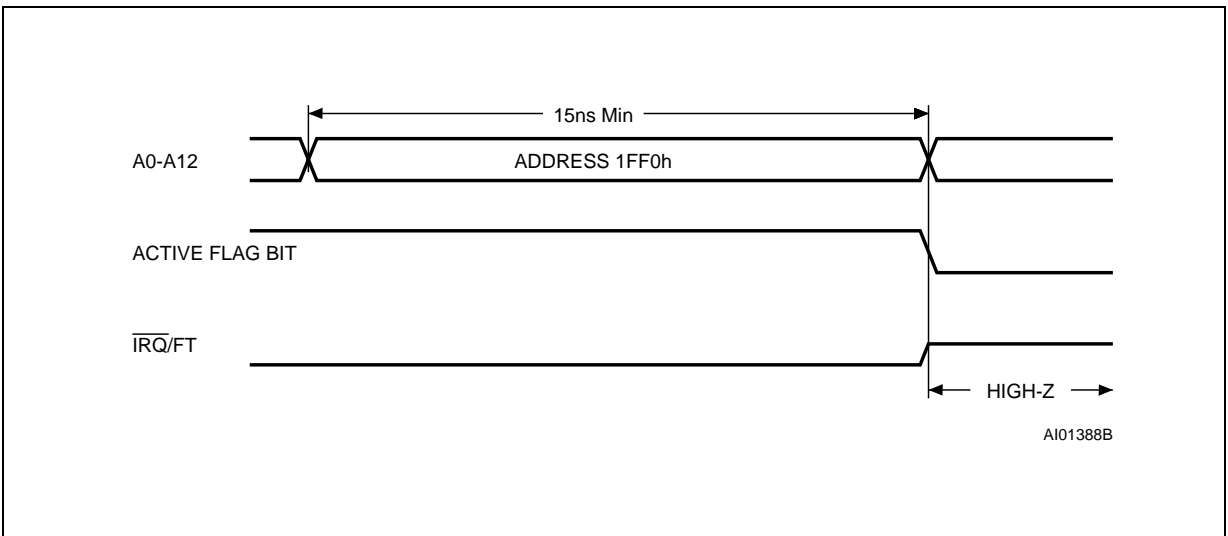

When the clock information matches the alarm clock settings based on the match criteria defined by RPT1-RPT4, AF (Alarm Flag) is set. If AFE (Alarm Flag Enable) is also set, the alarm condition activates the $\overline{\text{IRQ}}/\text{FT}$ pin. The alarm flag and the $\overline{\text{IRQ}}/\text{FT}$ output are cleared by a read to the Flags register as shown in Figure 11.

The $\overline{\text{IRQ}}/\text{FT}$ pin can also be activated in the battery back-up mode. The $\overline{\text{IRQ}}/\text{FT}$ will go low if an alarm occurs and both ABE (Alarm in Battery Back-up Mode Enable) and AFE are set. The ABE and AFE bits are reset during power-up, therefore an alarm generated during power-up will only set AF. The user can read the Flag Register at system boot-up to determine if an alarm was generated while the M48T59 was in the deselect mode during power-up. Figure 12 illustrates the back-up mode alarm timing.

Table 12. Alarm Repeat Mode

RPT4	RPT3	RPT2	RPT1	Alarm Activated
1	1	1	1	Once per Second
1	1	1	0	Once per Minute
1	1	0	0	Once per Hour
1	0	0	0	Once per Day

Figure 11. Interrupt Reset Waveforms

WATCHDOG TIMER

The watchdog timer can be used to detect an out-of-control microprocessor. The user programs the watchdog timer by setting the desired amount of time-out into the eight bit Watchdog Register (Address 1FF7h). The five bits (BMB4-BMB0) store a binary multiplier and the two lower order bits (RB1-RB0) select the resolution, where 00=1/16 second, 01=1/4 second, 10=1 second, and 11=4 seconds. The amount of time-out is then determined to be the multiplication of the five bit multiplier value with the resolution. (For example: writing 00001110 in the Watchdog Register = 3×1 or 3 seconds). If the processor does not reset the timer within the specified period, the M48T59 sets the WDF (Watchdog Flag) and generates a watchdog interrupt or a microprocessor reset.

The most significant bit of the Watchdog Register is the Watchdog Steering Bit. When set to a '0', the watchdog will activate the $\overline{\text{IRQ/FT}}$ pin when timed-out. When WDS is set to a '1', the watchdog will output a negative pulse on the $\overline{\text{RST}}$ pin for a duration of 40ms to 200ms. The Watchdog register and the FT bit will reset to a '0' at the end of a watchdog time-out when the WDS bit is set to a '1'.

The watchdog timer resets when the microprocessor performs a re-write of the Watchdog Register. The time-out period then starts over. The watchdog timer is disabled by writing a value of 00000000 to the eight bits in the Watchdog Register. The watchdog function is automatically disabled upon power-up and the Watchdog Register is cleared. If the watchdog function is set to output to the $\overline{\text{IRQ/FT}}$ pin and the frequency test function is activated, the watchdog function prevails and the frequency test function is denied.

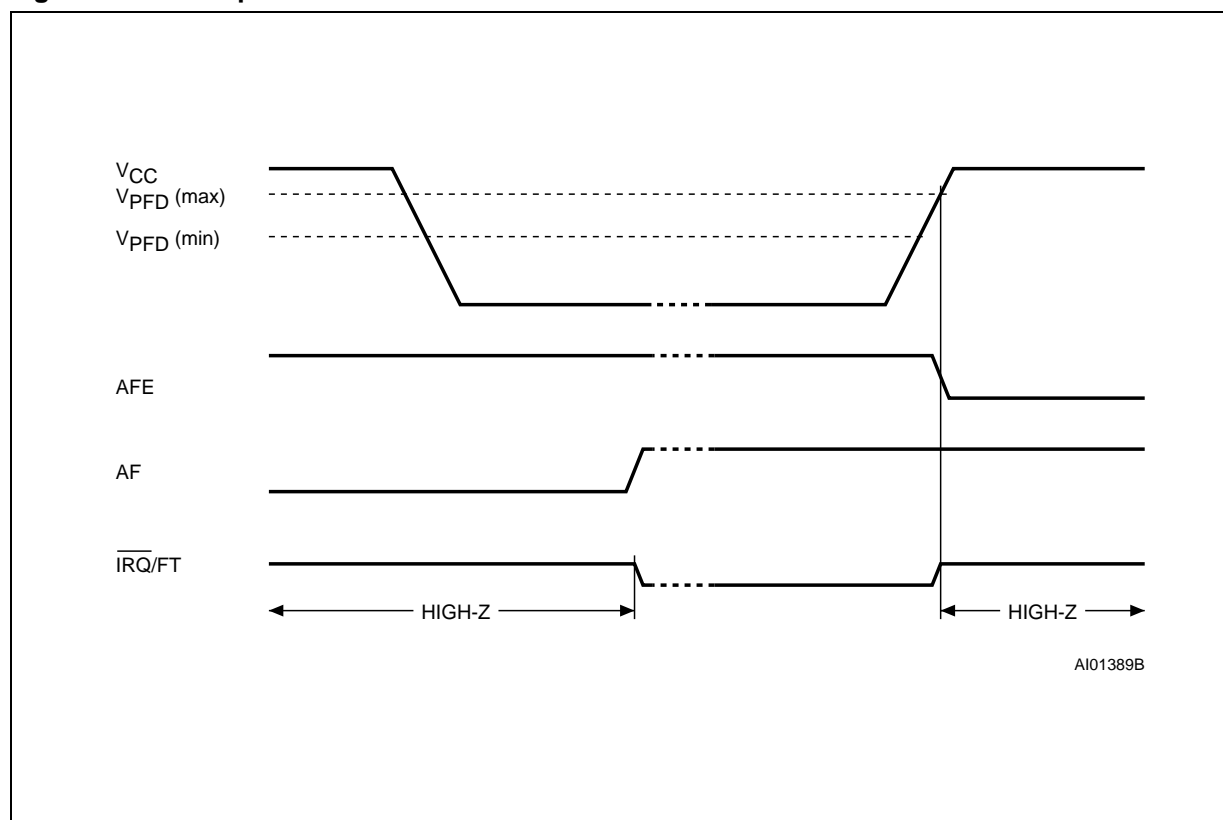

BATTERY LOW WARNING

The M48T59 checks its battery voltage on power-up. The BL (Battery Low) bit (D4 of 1FF0h) will be set on power-up if the battery voltage is less than 2.5V (typical).

POWER-ON DEFAULTS

Upon application of power to the device, the following register bits are set to a '0' state: WDS; BMB0-BMB4; RB0-RB1; AFE; ABE; W; R; FT.

Figure 12. Back-up Mode Alarm Waveforms

POWER SUPPLY DECOUPLING and UNDER-SHOOT PROTECTION

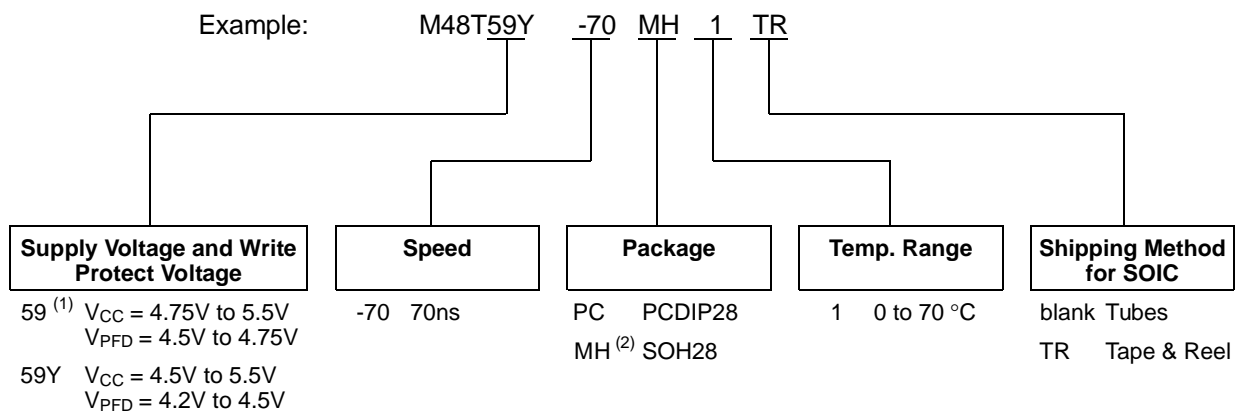

V_{CC} transients, including those produced by output switching, can produce voltage fluctuations, resulting in spikes on the V_{CC} bus. These transients can be reduced if capacitors are used to store energy, which stabilizes the V_{CC} bus. The energy stored in the bypass capacitors will be released as low going spikes are generated or energy will be absorbed when overshoots occur. A ceramic bypass capacitor value of $0.1\mu\text{F}$ (as shown in Figure 13) is recommended in order to provide the needed filtering.

In addition to transients that are caused by normal SRAM operation, power cycling can generate negative voltage spikes on V_{CC} that drive it to values below V_{SS} by as much as one Volt. These negative spikes can cause data corruption in the SRAM while in battery backup mode. To protect from these voltage spikes, it is recommended to connect a schottky diode from V_{CC} to V_{SS} (cathode connected to V_{CC} , anode to V_{SS}). Schottky diode 1N5817 is recommended for through hole and MBRS120T3 is recommended for surface mount.

ORDERING INFORMATION SCHEME

Notes: 1. The M48T59 part is offered with the PCDIP28 (i.e. CAPHAT) package only.
 2. The SOIC package (SOH28) requires the battery/crystal package (SNAPHAT) which is ordered separately under the part number "M4T28-BR12SH1" in plastic tube or "M4T28-BR12SH1TR" in Tape & Reel form.

Caution: Do not place the SNAPHAT battery/crystal package "M4T28-BR12SH1" in conductive foam since this will drain the lithium button-cell battery.

For a list of available options (Speed, Package, etc...) or for further information on any aspect of this device, please contact the SGS-THOMSON Sales Office nearest to you.
